EXECUTIVE SUMMARY:

The ongoing business has turned towards digitalization. The computerized world is the most applicable spot for business. It is prescribed to every business to have a significant impact on advanced and online stages. Keeping this thought in our mind. Our group has tried to build a website which can cater to all your sporting needs. Our group commenced the project with a thought process to create an app that would exclusively deal with sports goods. After brainstorming sessions, our group devised ways and means to get started with it. Certain parameters and benchmarks were decided upon which included an inventory of products the customers want to buy. The inventory was further divided into categories such as Hard goods, Soft Goods, Clothing, Supplements, Footwear, and Kids Section. A search on internet was conducted to get reliable information about the products that we offered on our website. This project was split into 4 lab assignments with initialization and basic structure in the first part. Then it progressed systematically culminating into a fully functioning prototype website. Concepts like HTML, JAVA, JDBC, and CSS were used for this website. Some basic features that were must for a website like privacy of customers, order list and summary, and most important of all, that is easy to understand and friendly user interface. The user can select items from a wide selection of products to their shopping cart where items can be removed, or the quantity can be increased. The order summary can be maintained and tracked as well. This summary is saved in their respective profile accounts for future references. The customer profiles are secured via a

login username and password. Even when the customer wants to checkout, a unique customer id is asked before the order is placed by them. Our group has tried to maintain high standards in creating this app and overall, it was a great learning experience for all the members.

SYSTEM FEATURES:

1. USER SECURITY:

   Our website takes special care about user privacy and security. Before the user can make any purchase, they have to login using username and password. Each user has a unique customer id which can be used for other things as well. For instance, if the user wants to check out, they must enter their customer id and then the website will take the user to checkout page.

2. USER INFORMATION:

   Our website stores information of different users in the DDL file that is extracted from there and used on the website. Apart from username, more details like address are also stored in the DDL file so that during checkout, the user/customer does not have any hassle and just must enter their payment details.

3. PRODUCT INFORMATION:

   Apart from user details, product information is also stored in the DDL file. This includes, product images, inventory count also. These details help the user get more information about the product they want to purchase. There is a different feature in our website in which every product has an individual page containing information.

4. TRACK OF SALES:

   Our website also keeps track of sales in two ways. One is a table showing list of all orders that are categorised by user ids and names. Then, a sub-table for each user is printed which contains products that were purchased.

5. AESTHETICS OF THE WEBSITE:

   We have taken care of aesthetics of the website. We have used CSS throughout the website that makes it looks pleasing. Apart from the color-changing background, we also changed the table design, headers and buttons with hover feature that contributes to the aesthetics of the website.

6. USER FRIENDLY INTERFACE:

   Our group has made sure that we keep a user-friendly interface where all the buttons are named with easy to recognise names so that even people with minimal technology knowledge can use our website. The font size of buttons, headers, are kept bigger so that it could read easily.

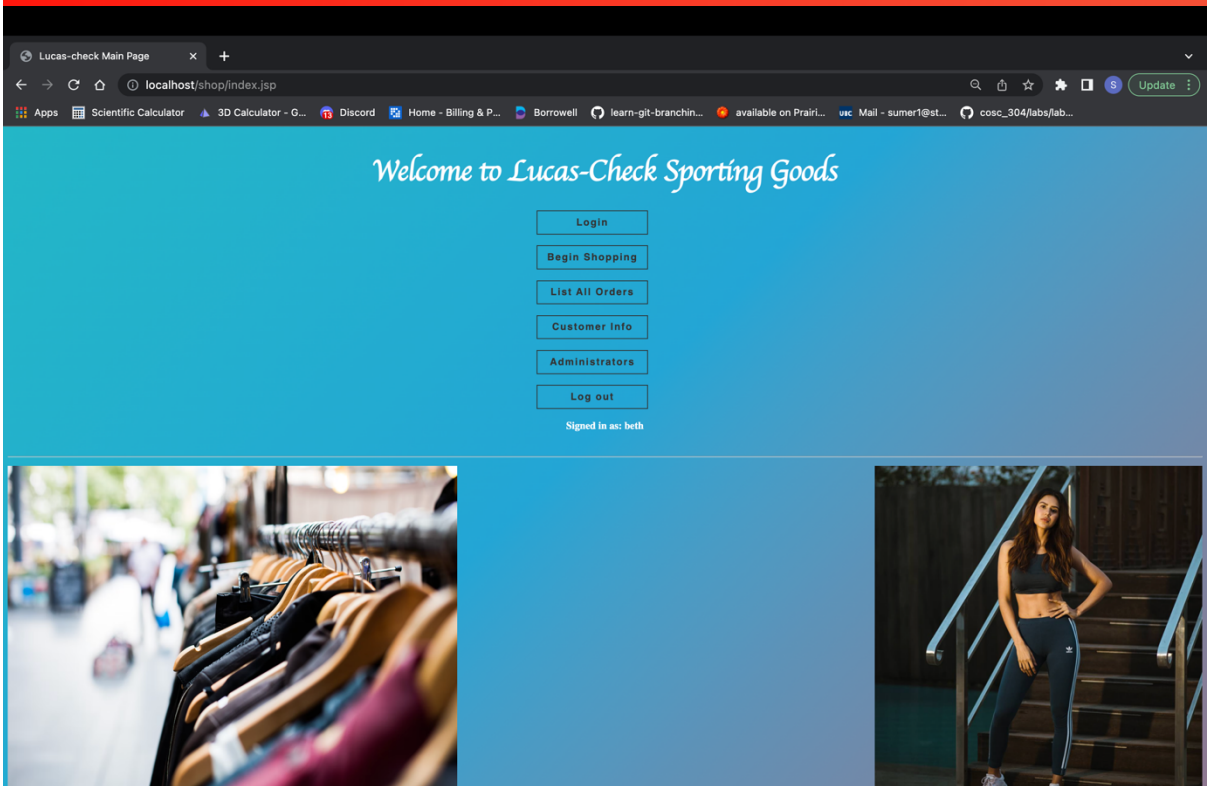

WALKTHROUGH THE WEBSITE:

1. USER OPENS THE WEBSITE AND SEES OUR MAINPAGE:

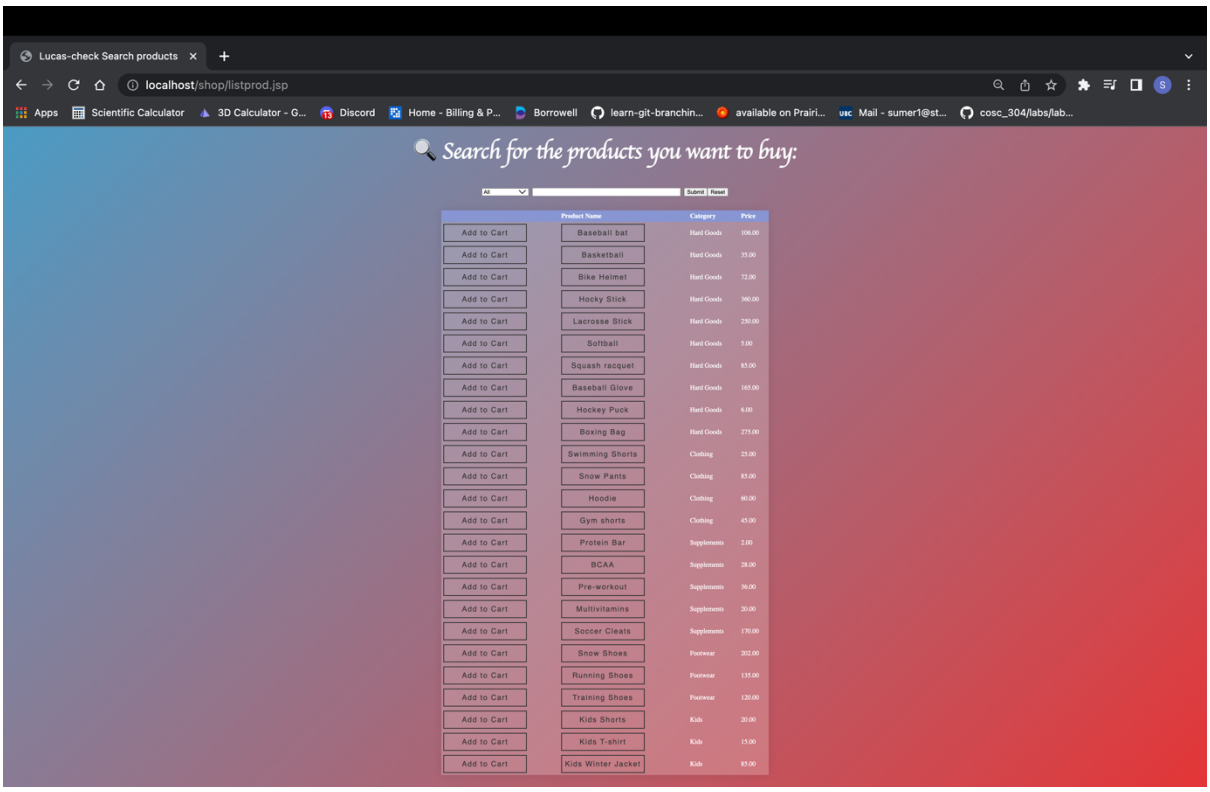

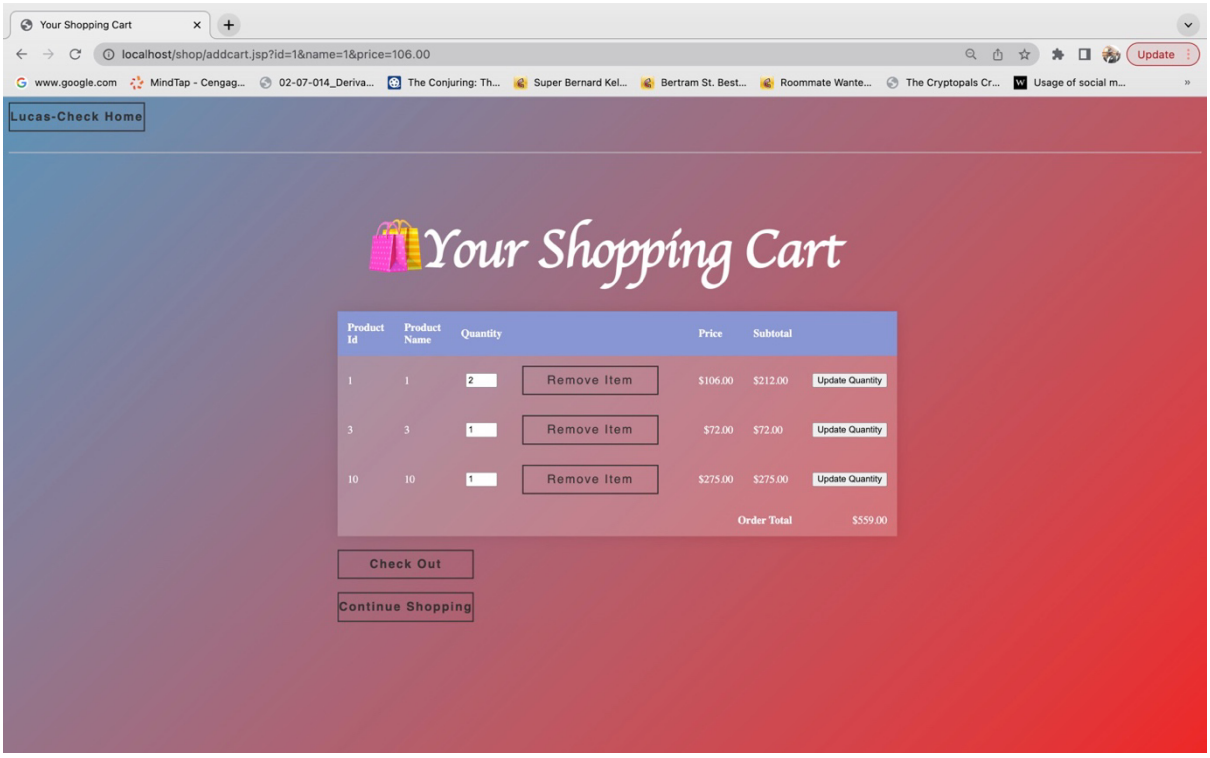

2. USER LOGIN INTO THE WEBSITE WITH USERNAME AND PASSWORD:

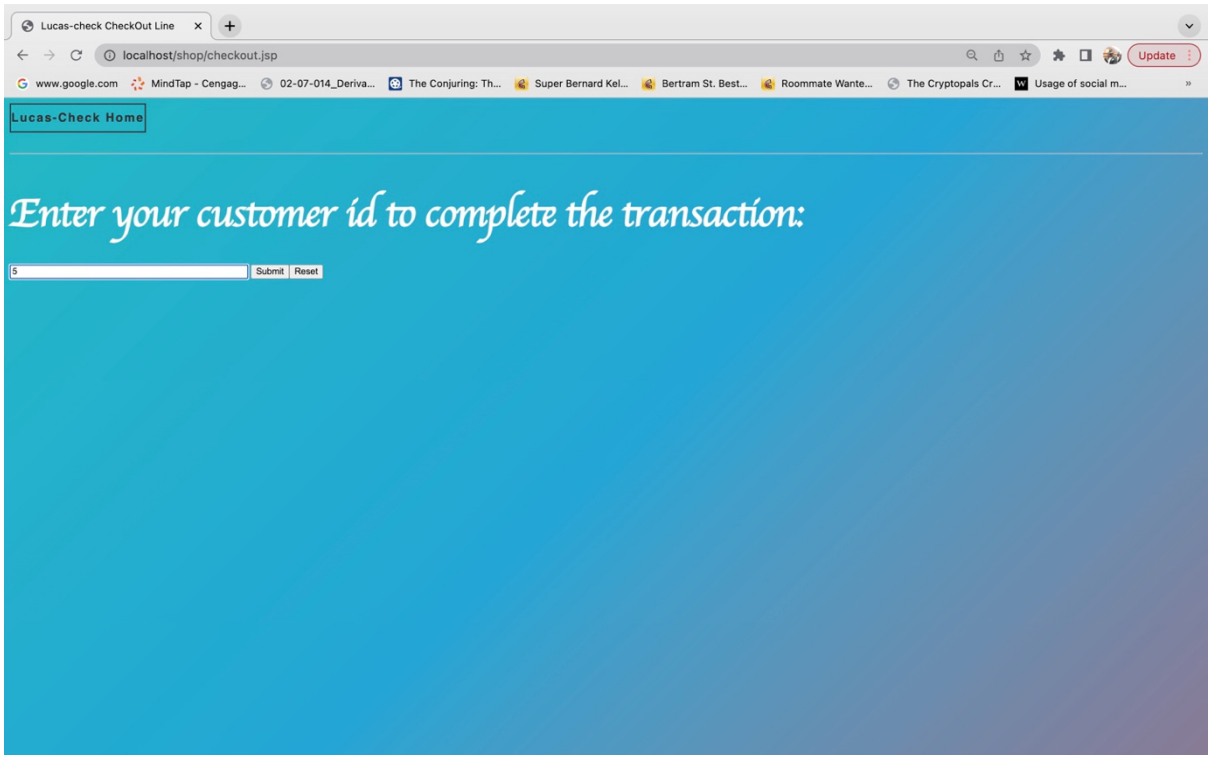

3. USER STARTS SHOPING AND SELECTS PRODUCTS THAT THEY WANT:

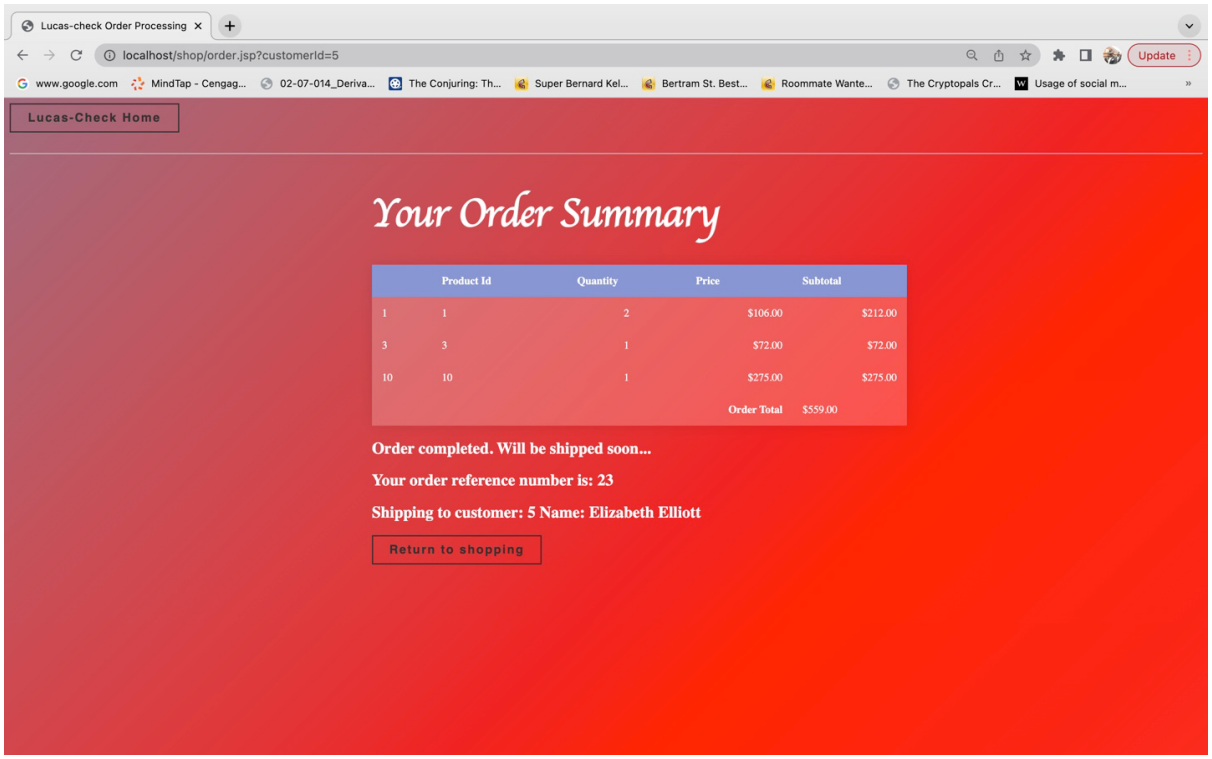

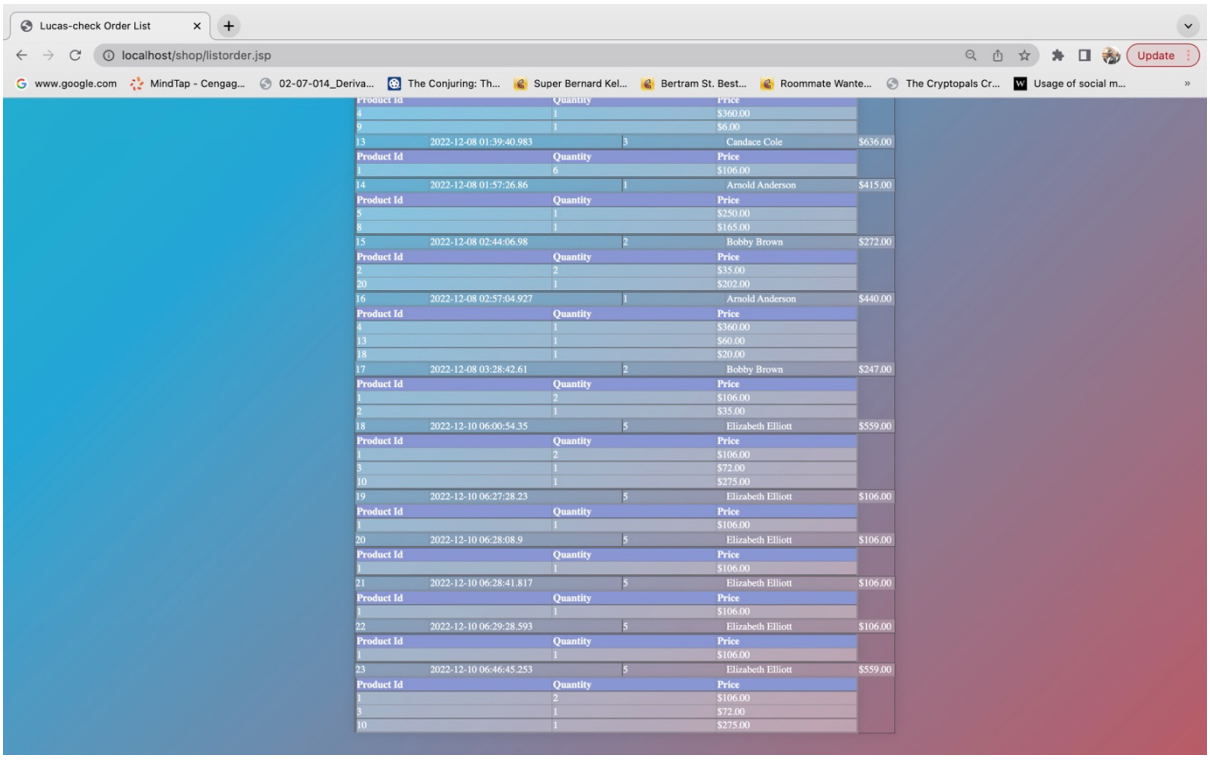

4. ONCE SELECTED, WE CAN CLICK ON THE CHECKOUT TO PROCESS FURTHER.

5. AFTER SUBMITTING, WE CAN SEE THE ORDER SUMMARY

6. WE CAN ALSO SEE THE LIST OF ALL ORDERS INCLUDING THE RECENT ONE MADE…

7. AND FINALLY, THE USER CAN ALSO SEE SALES REPORT BY THE DAY
